                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs as a sily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the secification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
     molecules (PTAMS) given in AAY82317 to AAY82324. The PTAMS have cytostatic, antiarthritic, antiasthmatic, immunosuppressant, antiarteriosclerotic, antiallergic, antidiabetic, antiipsemic, antirheumatic, osteopathic, dermatcological, antianaemic, antipsoriatic, hepatotropic, antiquout, antiinflammatory and antiHTV activities, and regulate protein transport. PTAM proteins and antagonists are useful for preventing or treating a disorder associated with decreased or increased expression or activity of PTAM. PTAM, polynucleotides are useful for diagnosing conditions associated with PTAM, comprising detecting PTAM by forming a hybridisation complex, preferably after PCR amplifying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; protein transport molecule; PTAM; diagnosis; antiarthritic; antiathmatic; immunosuppressant; ant antialleggic; antidiabetic; antilipeemic; antirheum dermatological; antianaemic; antipsoriatic; hepatot;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY82323;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoassays (ELISA). Disorders which are diagnosed or treated
                                                                                                                                                                                                                                                                                                                                                                                                                                              include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiaca arrest, cerebrovascular disorders e.g. cardiaca arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-DEC-

Claim 11; SEQ ID No 1181; 980pp; English

The invention relates to isolated nucleic acid molecules and their concoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses; cats, dogs, chickens or sheep. They care also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoassays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. englasms of the breast or liver, cardiovascular disorders e.g. cardiae arrest, cerebrovascular disorders e.g. cardiae arrest, cerebrovascular disorders e.g. cardiae infection, and many other cardiovascular disorders e.g. corneal infection, and many other allowed to aid wound healing and epithelial cell proliferation, to prevent skin aging due to supphyrn. Fo maintain organs before capabilities, fat content, lipid, protein, carbohydrate, minerals, cofactors and other nutritional components. The sequence represents a novel secreted protein of the invested protein of the investe prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be as a food additive or preservative to increase or decrease storage The present vitamins used

PTAM proteins and antagonists are useful for preventing or treating a disorder associated with decreased or increased expression or activity of PTAM. PTAM polynucleotides are useful for diagnosing conditions associated with PTAM, comprising detecting PTAM by forming a hybridisation complex, preferably after PCR amplifying the biological sample. Diseases prevented, treated or diagnosed include cell proliferative disorders such as cancers, immune disorders, secretory disorders and other conditions associated with abnormal vesicle trafficking, such as allergies, asthma, urticaria and autoimmune haemolytic anaemia. Anti-PTAM antibodies may be used as antagonists, as

The invent useful in developmental biology and in elucidating cell signalling cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid genes from Drosophila and interactions -

                                                                                                                           capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511) and the encoded proteins
Sequence 688 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila, developmental biology, cell signalling, insecticide, pharmaceutical.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGHTG-ABLIGHT), expressed DNA sequences (ABLIGHTG-ABLIGHT), expressed DNA sequences (ABLIGHTG-ABLIGHT).
                                                                                                                                                                                                                                                                                                                                           at ftp.wipo.int/pub/published_pct_sequences.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
